

## **Seed Production with Cool Season Forage Grasses**

The objective is to evaluate seed production of several cool season forage grasses for use in reclamation plantings with a view to encouraging forage seed growers to begin growing them.

There is a market for cool season forage seed for use in reclaiming disturbed land in northern climates. To meet this demand, it is important to know where we might be able to grow seed of these species. It is also important to know the climatic limitations for each candidate species. To address these issues we have undertaken a small trial to evaluate seed production at Melfort for several cool season forage grass species.
